SUMMARY

Fresh Software Engineering Graduate with hands-on experience building backend systems in Java (Spring Boot). JLPT N4 certified, currently studying toward N2. Comfortable translating real-world business requirements into practical technical solutions. Seeking a Fullstack Developer role in Japan-oriented projects to grow both technical expertise and Japanese communication skills, with a long-term goal of becoming a Bridge System Engineer (BrSE).

TECHNICAL SKILLS

- Programming Languages: Java, PHP, C#, .NET, Python
- Databases: MySQL, SQL Server
- Frameworks / Libraries: Spring Boot (JPA, Security), FastAPI, React
- Tools: Git, GitHub, Postman, Docker

PROJECT

Social Media Platform | *SpringBoot, MySQL, Docker* **Feb 2026 - Apr 2026**
Team size: 4 (Backend Developer)

- Built RESTful APIs for core social features with JWT authentication and an infinite scroll news feed.
- Optimized relationship queries using composite indexes and implemented Server-Sent Events (SSE) for real-time notifications.
- Built a custom reverse proxy in Spring Boot to forward requests to a Node.js chat service (handling auth header propagation) and deployed on Render via Docker.
- Github / Live demo

Fish Store Management Website | *SpringBoot, ReactJS, MySQL* **May 2026 - July 2026**

- Developed RESTful APIs with Spring Security (JWT-based RBAC) for B2B/B2C order and inventory management.
- Engineered complex inventory logic (FIFO tracking, unit conversion, perishable goods) with automated stock adjustments.
- Utilized Server-Sent Events (SSE) and scheduled jobs for real-time expiring inventory alerts.
- Integrated VNPAY for online payments and implemented a credit/debt tracking system for wholesale customers.
- Github / Live demo

Snake Vision (AI Recognition System) | *Python, FastAPI, YOLOv11, OpenCV, SQLite* **Feb 2026 - May 2026**

- Developed a FastAPI backend integrating a custom YOLOv11 model for real-time snake species recognition via image uploads, video sampling, and base64 live camera feeds.
- Trained and evaluated the YOLOv11 object detection model on a custom-labeled dataset of 18 regional species via Roboflow, analyzing PR/F1 curves to optimize inference accuracy.
- Designed RESTful APIs and a SQLite database to manage detection history, system statistics, and deliver critical medical data (venom levels and first-aid instructions).
- Github

EDUCATION

Bachelor of Engineering in Information Technology, Saigon Technology University (STU)

- Major in **Software Engineering**
- **GPA: 3.2/4.0**
- Graduatied: 2026

CERTIFICATES

- TOEIC: 620 (05/2026)
- Japanese: JLPT N4 (07/2025)
